

supported at side frames of a frame and has seat plates, one side of each of which is supported and connected at the head of a stay so as to be pivotable about a front-back shaft. The seat plates are folded by compound motion of swing of the stays and swing of the seat plates, the swing of the stay occurring at the section where the stay is pivotally supported at a side frame, the swing of a seat plate occurring at the section where the seat plate is supported and connected at the stay. The seat plates are folded to sides of the occupant, to more rear-upward than an extended position, with the surfaces vertically set. An L-shaped, reverse L-shaped, or lateral T-shaped stay is used as the stays, and the stays are supported at the side frames of the frame so as to be pivotable about vertical shafts.
